A photograph showing a person's feet in worn, brown sandals with mesh inserts, standing on reddish-brown soil. A banana is visible on the ground to the left, and a white sack is partially visible on the right. The scene appears to be outdoors in a rural or agricultural setting.

Managua and Thika/Chanai Baseline survey results

Kenya

Nairobi

Results

- $n = 730$ interviews
- Reliability
 - 95% confidence interval
 - Internal consistency: asked key questions such as land size, irrigation and water sources two slightly different ways
 - Inter-enumerator reliability: no out of range data could be entered in the iPads; tracked time taken for each interview automatically

Results

- Validity

- Margin of error = 5.1% for each sub-catchment sample and 3.4% for total sample
- Male = 53% and female = 47%
- Average age of respondents = 48

Kangari ward	94%	6%	148
Kariara ward	93%	7%	134
Overall average	93%	7%	730

Discussion

- Larger farms in Thika/Chanai than Maragua; thus need fewer farmers to participate
- Lower diversity of crops in Thika/Chanai than Maragua; thus need fewer solutions to water-quality issues
- Farm land is steeper in Thika/Chanai than Maragua; thus activities have greater impact on water-quality issues

Discussion

- More people were born in the local area in Thika/Chanai than Maragua; thus may have deeper ties to the land.
- Fewer trees in Thika/Chanai than Maragua; thus more opportunity for agro-forestry and reforestation
- Greater existing participation in environmental groups in Thika/Chanai than Maragua; thus easier to build on what already exists

Conclusions

- Some sub-catchments will be easier to work in than others.
- In the medium-term, the water fund should consider focusing on the sub-catchment where we have the greatest chance of demonstrating success and then expand to other sub-catchments.

A good start to our partnership
