

An ecoregional conservation assessment
of the Coastal Forests and Mountains

Conservation of Functional Landscapes in Southeast Alaska

Watershed-scale Protection and Forest Condition

The opportunity to conserve large, intact landscapes within the coastal temperate rain forest biome is rare, and limited primarily to areas of Southeast Alaska and northern British Columbia. This map reveals watersheds with >95% of productive forests intact (green / orange), and those with watershed-scale protection (green / blue). Watersheds shown in orange are intact watersheds within the development landscape, and may be considered as candidates for future watershed-scale protection.
